Clean Air Project - Prompt history

This document separates the written conversation into:

1. **Build:** prompts 1-11.
2. **Issues after the build and other follow-ups:** prompts 12-20.

The prompt wording, spelling, capitalization and punctuation are preserved, including typos and repeated words. Paragraph breaks inside table cells are represented with `<br><br>`. The action summaries are separate from the prompts.

Automatically inserted timestamps, IDE selections and browser attachments are excluded. Menu-based approval selections are not counted as written prompts. Prompt 20 is the request to create this document.

Table 1 - Build (prompts 1-11)

#	Your exact prompt	What I did based on that prompt
1	Hello this is the new Clean Air Project. I want us to do our best to implement it a very awesome and good and stable Project for this. Have a look at the, "The Task" - once you understand it let me know what you understand please.	• Read both assignment images. • Explained the business goal, functional requirements, data requirements and submission expectations. • Did not start implementation yet.
2	lets make the cleanliness be configurable, do research online unless you know so we can have acceptable good range for the air cleanliness. give me a good plan for this please.	• Researched WHO guidelines, the European Air Quality Index and EEA data access. • Proposed configurable pollutants and daily reference thresholds. • Explained why daily, annual and hourly standards must not be mixed.
3	ok but will I need to login or have some account somewhere to get this running, or can I host it locally?	• Explained how the application could run locally without cloud accounts or application login. • Distinguished internet access for collecting measurements from local searches against stored data.
4	so what would I need to install, docker and SQL DB or something, can I not use these can I somehow make it	• Compared Docker, PostgreSQL, SQLite and file-based storage.

#	Your exact prompt	What I did based on that prompt
	fully custom or do you think you reccomend docker and a real DB?	• Recommended SQLite for a simpler local application, with Docker optional. • Explained that building a custom application did not require building a custom database engine.
5	ok lets start with python but for SQLite do I need to install it or is it a part of Python somehow?	• Explained Python's built-in sqlite3 module and that no separate database server was needed. • Provided example connection code and a command for checking SQLite availability. • Did not perform the installation check until the next prompt.
6	I think I've got Python, check for me and then lets plan the implementation, I want you to to keep it as simple as possible yet fully functional according to the requirements.	• Verified Python 3.12.10, SQLite 3.49.1, pip and virtual-environment support. • Successfully tested SQLite reads and writes in memory. • Refined the plan to FastAPI, server-rendered HTML, SQLite, one collector and local monitoring.
7	ok but I want you to build everything in a way that it is all in this workspace only - I want to give this to my colleagues at then end and I want to just be able to zip the workspace and then hand it over. So please, create all the relevant folders and files for the complete deliverable project in this workspace.	• Implemented the application, UI, real EEA collection, SQLite storage, configurable comparisons, archiving, backups, monitoring and documentation. • Bundled portable Python 3.13.16, dependencies and Prometheus; imported a twelve-month span of real measurements and created the handover ZIP. • Verified 60 tests, performance and relocation, and recorded four local development milestones.

#	Your exact prompt	What I did based on that prompt
8	Can you give me short, easy simple instructions here in the chat on how to start up the project and how to use it. Easy simple short instructions. Also can it have online access to real-time data as well or only historical based on already pulled data, or does it connect live to online data?	• Provided simple startup, usage and Ctrl+C shutdown instructions. • Explained startup/hourly EEA updates while the application runs. • Clarified that historical searches use stored data and that the interface was not an instant sensor-streaming dashboard.
9	how many prompts did I use here to create this project end to end and summarize what each prompt was about please	• Counted and summarized the prompts available at that stage. • Distinguished the seven initial planning/build prompts from subsequent questions and the three initial approval selections.
10	close all python stuff as to let go of all the resources, I want to create a ZIP of the folder myself and currently cant because of some resource locked and used by python.	• Identified and stopped the project's Python and Prometheus processes using their validated process IDs. • Flushed SQLite and confirmed database integrity. • Started a broader file-lock verification, but that verification was interrupted before completion.
11	do we have a Stop-CleanAir.cmd, we need one that releases all the resourses please	• Added the Stop-CleanAir.cmd launcher, cooperative shutdown control and scoped leftover-process cleanup. • Tested clean shutdown, repeated stopping, database release and preservation of unrelated Python processes; retained normal Ctrl+C behaviour. • Reached 68 passing tests, updated documentation and the handover ZIP, and recorded the fifth local milestone.

Table 2 - Issues after the build and other follow-ups (prompts 12-20)

This table includes requirement reviews, publication, Git/LFS questions and explanations, as well as issues. Not every entry resulted in a code change.

#	Your exact prompt	What I did based on that prompt
12	Can you please check for me quickly based on the actual requirements we have, you know that were given to us? Have you? Covered all the requirements. Check them one by one, give me a list and tell me.	• Compared the original assignment with the actual code, documentation and current database. • Reported three coverage-gap dates, automatic archiving's dependency on successful collection, and the missing published repository URL. • Explained local validation/deployment caveats. This was an audit; I did not fix the identified data or archive issues during it.
13	I created a new public git repository and I want to upload the whole project there. Please upload the whole project, the root file, everything 1 commit. Thank you. https://github.com/ivanjdrakovFourth/Clean-Air-Project.git	• After your packaging selection, published 54 source/configuration/documentation/test files at the repository root in one snapshot commit, c2e897a. • Published the complete portable ZIP and checksum as GitHub Release v1.0.0, then verified the uploaded asset. • Preserved the five development commits locally and excluded internal Git metadata and live/generated state from the public ZIP.
14	Did you upload everything? I want the complete portable Windows release to be there, not just the Github repository, source files and configurations and all that. I want everything to be up in git.	• Rechecked the complete Release ZIP and clarified the difference between Releases and files tracked in main. • After your approvals, added the runtime and database through Git LFS: 2,683 tracked files, including 78 LFS objects, while replacing main with one commit, 87cbb8f. • Reached 69 passing tests and verified a fresh GitHub LFS checkout containing actual executables and a valid database.

#	Your exact prompt	What I did based on that prompt
15	is everything now there all the runtime stuff and all?	• Confirmed that the required runtime, packages, monitoring tools, database and application files were uploaded. • Reiterated the distinction between Git LFS retrieval and the ordinary portable Release ZIP. • Made no further project changes.
16	What is the command to pool everything including the umm. Portable zip including the LFS. What is the git command so I pull everything?	• Supplied PowerShell commands for cloning, pulling and retrieving LFS objects. • Explained that Git does not download GitHub Release assets. • Provided a separate portable-ZIP download command; these were instructions, not commands I executed for you.
17	OK. It's very important that I'm able to explain, umm, exactly how I built this project. So I want you to give me every single prompt that I wrote, and I want you to give me that prompt. Exactly as it is. No changes, nothing. Every prompt from the beginning up until the end in a table, and I want after the prompt for you to explain shortly, in a couple or a few bullet points exactly what you did. Based on that prompt, this is the first part of the deliverable that I need. Give it to me and then I'll tell you what I want afterwards.	• Prepared a chronological record using your original written wording. • Summarized the actual responses and implementation work at each stage. • Separated six menu-based approval selections from typed prompts; did not change project files.
18	Uh, my friend already has in his local workspace in his Visual Studio Code on his machine the full project. And now he wants to upload and push everything to his own git repo. So what exactly is the command and what does he have to do so that he can push everything the complete project including the? LFS.	• Explained how to publish the complete local project and LFS objects to his own empty repository. • Emphasized using the current Git attributes/ignore rules and a separate remote to avoid pushing to the original repository. • Provided commands and authentication guidance; did not access or execute commands on his machine.
19	OK so why am I only seeing three cities? I only see Sophia, Varna and another city so I want to know. Do we have in the database collected	• Queried the actual SQLite database and confirmed measurements for 17 cities and

#	Your exact prompt	What I did based on that prompt
	other cities? How many? What is the total amount of cities we have clean air for which is in the database currently	217,048 source observations at the time of the check. • Reproduced the recent PM2.5 view showing Sofia, Varna and Ruse, and explained the pollutant and coverage filters. • Confirmed that PM10 qualified 14 cities for the checked recent period and 13 for the checked year; made no code changes.
20	Please create for me AMD file with the table that I asked about with all the prompts and the few bullet marks of what each prompt does. You don't have to include all of them. OK I want, probably I want up until. One moment, I went up until the 11th prompt. OK. I just want those ones. Then you can include the other ones from 12 up until the rest, but include them in a separate table below the 1st one. The first table is the build, the 2nd table is like issues after.	• Created this Markdown document with the requested two-table split. • Kept prompts 1-11 under Build and prompts 12-20 under Issues after the build and other follow-ups. • Preserved prompt wording and kept the action summaries brief; did not modify application code or measurement data.
